Monthly Commentary

The month of February was highly volatile. US consumer price data (CPI) came in higher than expected at a headline rate of +7.5% (YoY). This was the highest level since February 1982. As 10-yr US treasury yields have risen to more than 2%, prospects for growth stocks have deteriorated. During the latter part of the month the focus has shifted to geopolitics. Equity markets came under pressure as Russia invaded the Ukraine and harsh sanctions were introduced, such as removing some Russian banks from the SWIFT network and freezing central bank assets. As the price of Brent oil continued to rally from \$ 91.2/barrel to \$ 101.0 at month end, the energy equity market segment was able to gain. Energy transportation led the shipping segment. Tanker rates have rallied at the end of the month with the Aframax and Suezmax segment taking the lead. Capesize-rates were flattish around \$14k/day. The overall fund performance was positive. Short positions have in aggregate contributed positive-ly.

Disclaimer Seahawk Equity Long Short Fund USD-S

The information is intended for information purposes only and does not represent a request to buy or sell fund units. On account of its composition and investment policy, the investment fund assets carry a risk of increased volatility that cannot be ruled out. This means that unit prices may fluctuate significantly upwards or downwards within short time periods. The only documents which form the basis for acquiring units are the sales documents (Key Investor Information Document, Sales Prospectus and annual and semi-annual reports) on investment funds, from which you can obtain detailed information on risks. They may be obtained in German and free of charge from the Management Company IPConcept (Luxemburg) S.A. (www.ipconcept.com) and from the German paying and information agent DZ BANK AG; Deutsche Zentral-Genossenschaftsbank, Platz der Republik, D-60265 Frankfurt am Main.

(1) The performance-related remuneration is based on the past financial year. The key fund data is determined on the basis of daily information. No fund data is determined for funds launched less than one year ago.

(2) Past performance is not a reliable indicator of future trends. Performance is determined using the BVI method (without taking front-end loads into consideration). With an investment amount of EUR 10,000 over a five-year investment period and a 5% front-end load, the front-end load amounting to EUR 500 and any additional custodian fees incurred would be deducted from the investment result during the first year. Any individual custodian costs incurred may be deducted from the investment result over subsequent years. Performance is determined using the BVI method. The fund performance in line with the BVI method is the percentage change in the unit value between the beginning and the end of the calculation period. The BVI fund category is derived from the fine categorisation of the BVI.

(3) The top 5 holdings are understood to have taken derivatives into account. All information on the asset-class shares (large cap, medium cap and small cap) relates to the Fund's assets. All information on the asset-class fixed income relates to the Fund's assets.

(4) Risk information: On account of its composition/the techniques used by fund management, the investment fund shows an increased level of volatility. This means that the unit prices may fluctuate significantly upwards or downwards within short time periods.

Under normal market conditions, the key performance data and risk-adjusted performance data refer to a period covering the past three years. With funds launched between one and three years ago, the key data refers to the period since the fund's launch.

Volatility: Volatility normally means the fluctuation risk of, for instance, a fund. The standard deviation of the performance figures over the period under consideration serves as the mathematical basis; when annualised, this is described as volatility. Volatility of 5% with an average annual performance of 7% means that the next annual performance will (with a 68.27% probability rate) probably be between 2% (=7%-5%) and 12% (=7%+5%).

Sharpe ratio: The Sharpe ratio is the difference between the performance achieved per annum and the risk-free interest rate (Deutsche Bank USD 1 M LIBOR TR Index), divided by the volatility. Therefore, it can be interpreted as the risk premium per unit measured against the overall risk entered into. As a general rule, the higher it is, the better (high performance with a low risk). Owing to their relative size, Sharpe ratios of various portfolios can be compared with one another.
